

LC²MOS Quad SPST Switches

ADG211A/ADG212A

FEATURES

44V Supply Maximum Rating
±15V Analog Signal Range
Low R_{ON} (115Ω max)
Low Leakage (0.5nA typ)
Break Before Make Switching
Single Supply Operation Possible
Extended Plastic Temperature Range
(-40°C to +85°C)
TTL/CMOS Compatible
Available in 16-Lead DIP/SOIC and
20-Lead PLCC Packages
Superior Second Source:
ADG211A Replaces DG211
ADG212A Replaces DG212

SWITCHES SHOWN FOR A LOGIC "1" INPUT

GENERAL DESCRIPTION

The ADG211A and ADG212A are monolithic CMOS devices comprising four independently selectable switches. They are designed on an enhanced LC²MOS process which gives an increased signal handling capability of ±15V. These switches also feature high switching speeds and low R_{ON}.

The ADG211A and ADG212A consist of four SPST switches. They differ only in that the digital control logic is inverted. In multiplexer applications, all switches exhibit break-before-make switching action when driven simultaneously. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

PRODUCT HIGHLIGHTS

1. Extended Signal Range:
These switches are fabricated on an enhanced LC²MOS process, resulting in high breakdown and an increased analog signal range of ±15V.
2. Single Supply Operation:
For applications where the analog signal is unipolar (0V to 15V), the switches can be operated from a single +15V supply.
3. Low Leakage:
Leakage currents in the range of 500pA make these switches suitable for high precision circuits. The added feature of Break before Make allows for multiple outputs to be tied together for multiplexer applications while keeping leakage errors to a minimum.

ADG211A IN	ADG212A IN	SWITCH CONDITION

NOTE

¹Sample tested at 25°C to ensure compliance.

Specifications subject to change without notice.

ABSOLUTE MAXIMUM RATINGS*

(T_A = 25°C unless otherwise stated)

V _{DD} to V _{SS}	44V
V _{DD} to GND	25V
V _{SS} to GND	-25V
V _L to GND	-0.3V, 25V
Analogue Inputs ¹	
Voltage at S, D	V _{SS} -0.3V to V _{DD} +0.3V
Continuous Current, S or D	30mA
Pulsed Current S or D	
1ms Duration, 10% Duty Cycle	70mA

*COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one Absolute Maximum Rating may be applied at any one time.

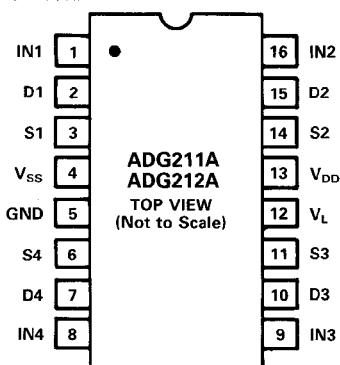

CAUTION

ESD (electrostatic discharge) sensitive device. The digital control inputs are diode protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The protective foam should be discharged to the destination socket before devices are removed.

P = Plastic Leaded Chip Carrier (PLCC).

ADG211A/ADG212A—Typical Performance Characteristics

The switches can comfortably operate anywhere in the 10V to 15V single or dual supply range, with only a slight degradation in performance. The following graphs show the relevant performance curves. The test circuits and test conditions are given in a following section, "Test Circuits."

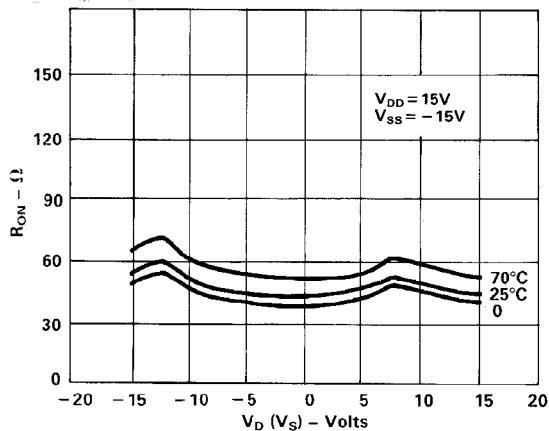

Figure 1. R_{ON} as a Function of V_D (V_S): Dual ± 15 Supplies

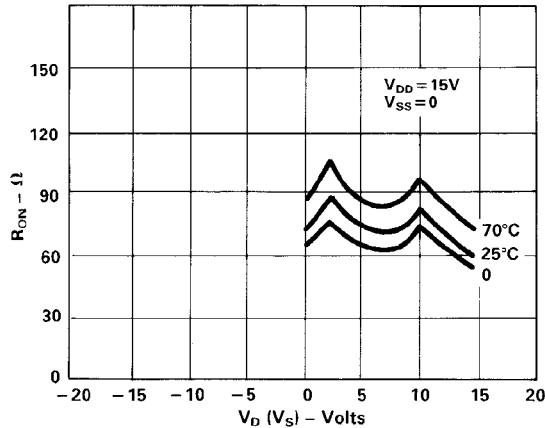

Figure 2. R_{ON} as a Function of V_D (V_S): Single + 15V Supply

TERMINOLOGY

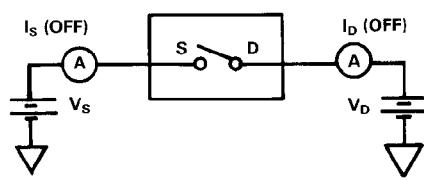

R _{ON}	Ohmic resistance between terminals OUT and S
R _{ON} Match	Difference between the R _{ON} of any two channels
I _S (OFF)	Source terminal leakage current when the switch is off
I _D (OFF)	Drain terminal leakage current when the switch is off
I _D (ON)	Leakage current that flows from the closed switch into the body
V _D (V _S)	Analog voltage on terminal D, S
C _S (OFF)	Switch input capacitance "OFF" condition
C _D (OFF)	Switch output capacitance "OFF" condition
C _{IN}	Digital input capacitance
C _D , C _S (ON)	Input or output capacitance when the switch is on
t _{ON}	Delay time between the 50% and 90% points of the digital input and switch "ON" condition

t _{OFF}	Delay time between the 50% and 90% points of the digital input and switch "OFF" condition
t _{OPEN}	"OFF" time measured between 50% points of both switches, which are connected as a multiplexer, when switching from one address state to another
V _{INL}	Maximum Input Voltage for a Logic Low
V _{INH}	Minimum Input Voltage for a Logic High
I _{INL} (I _{INH})	Input current of the digital input
V _{DD}	Most positive voltage supply
V _{SS}	Most negative voltage supply
V _L	Logic supply voltage
I _{DD}	Positive supply current
I _{SS}	Negative supply current
